

The scatter plot displays the relationship between the extent of resection (in cm.) and an unlabeled outcome variable. The x-axis ranges from 1 to 6 cm. The y-axis is unlabeled but has a grid. Data points are categorized by intubation status: blue for 'Not Intubated' and red for 'Intubated Patients'. Two regression lines are plotted: a red line for 'Intubated Patients' and a blue line for 'Not Intubated'. The red line shows a steeper positive correlation than the blue line.
